A biosensor is an analytical device, used for the detection of a chemical substance, that combines a biological component with a physicochemical detector. The sensitive biological element, e.g. tissue, microorganisms, organelles, cell receptors, enzymes, antibodies, nucleic acids, etc., is a biologically derived material or biomimetic component that interacts, binds, or recognizes with the ...

Nanocellulose, a unique and promising natural material extracted from native cellulose, has gained much attention for its use as biomedical material, because of its remarkable physical properties, special surface chemistry and excellent biological properties (biocompatibility, biodegradability and low toxicity).

Abstract. Nanomaterials offer new opportunities for cancer diagnosis and treatment. Multifunctional nanoparticles harboring various functions including targeting, imaging, therapy, and etc have been intensively studied aiming to overcome limitations associated with conventional cancer diagnosis and therapy.

### **Targeting Strategies for Multifunctional Nanoparticles in**

1. Introduction. The advent of nanoscience and nanotechnology has provided tremendous growth in research activities not only of the structural design of nanoparticles (NPs) but also for exploration of their properties []. Due to the size-dependent (e.g.,  $10^{-9}$  m) properties of NPs, nanotechnology is an important branch of nanomedicine and vice versa.
