A transformer is a static electrical device that transfers electrical energy between two or more circuits. A varying current in one coil of the transformer produces a varying magnetic flux, which, in turn, induces a varying electromotive force across a second coil wound around the same core. Electrical energy can be transferred between the two coils, without a metallic connection between the ...

Electric power is the rate, per unit time, at which electrical energy is transferred by an electric circuit. The SI

unit of power is the watt, one joule per second.. Electric power is usually produced by electric generators, but can also be supplied by sources such as electric batteries.It is usually supplied to businesses and homes (as domestic mains electricity) by the electric power industry ...
