Cell Culture Cell culture is one of the major tools used in cellular and molecular biology, providing excellent model systems for studying the normal physiology and biochemistry of cells (e.g., metabolic studies, aging), the effects of drugs and toxic compounds on the cells, and mutagenesis and carcinogenesis.

The device used for determining the number of cells per unit volume of a suspension is called a counting chamber. It is the most widely used type of chamber, since it was mainly designed for performing blood cell counts. It is now used to count other types of cells and other microscopic particles as well.

### **Hemocytometer (Counting of Cells) (Theory) : Cell biology**

OF THE CELL INTRODUCTION TO THE CELL Both living and non-living things are composed of molecules made from chemical elements such as Carbon, Hydrogen, Oxygen, and Nitrogen. The organization of these molecules into cells is one feature that distinguishes living things from all other matter. The cell is the smallest unit of

indirect counts of cells and direct and indirect measurements of microbial biomass. Each method will be described in more detail below. 1. Direct Count of Cells Cells are counted directly under the microscope or by an electronic particle counter. Two of the most common procedures used in microbiology are discussed below.

## **ENUMERATION OF MICROORGANISMS I. OBJECTIVES II. INTRODUCTION**

In the real application of automatic cell counting, the resolution of input medical image could be very high, at the same time the target cells could be very dense. Consequently, it is quite difficult to manually count target cells one by one. This is the original motivation of automatic cell counting.

Counting Cells with the LSR II Flow Cytometer Introduction: Cell counting is normally performed manually with a hemocytometer or with a dedicated, cell counting instrument such as an Invitrogen Countess, or a Beckman Coulter Vicell.

### **Counting Cells with the LSR II Flow Cytometer Introduction**

Most cells have cytoplasm, a cell membrane, a nucleus, mitochondria, ribosomes, and vacuoles. Cytoplasm is the thick liquid inside of cells in which other cell structures float. The cell membrane is the outer lining of the cell. It helps control which substances can enter or leave the cell. The nucleus of a cell is where the cell's DNA is stored;
