Probability is the measure of the likelihood that an event will occur. See glossary of probability and statistics. Probability quantifies as a number between 0 and 1, where, loosely speaking, 0 indicates impossibility and 1 indicates certainty. The higher the probability of an event, the more likely it is that the event will occur.

When two probability distributions overlap, statistical interference exists. Knowledge of the distributions can be used to determine the likelihood that one parameter exceeds another, and by how much. This technique can be used for dimensioning of mechanical parts, determining when an applied load exceeds the strength of a structure, and in many other situations. This type of analysis can also ...

The details about these tools will be brief as books are written about each item. Think of the presentations below as hors d'œuvres (a little snack food or starters)â€”not the main course. The most important reliability tool is a Pareto distribution based on moneyâ€”specifically based on the cost of unreliability which directs attention to work on the most important money problem first.
