DNA Scissors: Introduction to Restriction Enzymes Objectives At the end of this activity, students should be able to 1 . Describe a typical restriction site as a 4- or 6-base- pair palindrome;

Endonucleases are enzymes that cleave the phosphodiester bond within a polynucleotide chain. Some, such as deoxyribonuclease I, cut DNA relatively nonspecifically (without regard to sequence), while many, typically called restriction endonucleases or restriction enzymes, cleave only at very specific nucleotide sequences. Endonucleases differ from exonucleases, which cleave the ends of ...

Restriction Endonucleases - The Molecular Scissors. The term "Restriction enzyme" originated from the studies of Enterobacteria phage  $\lambda$  (lambda phage) in the laboratories of Werner Arber and Matthew Meselson.

History. In the late 1960s, scientists Stuart Linn and Werner Arber isolated examples of the two types of enzymes responsible for phage growth restriction in Escherichia coli bacteria. One of these enzymes added a methyl group to the DNA, generating methylated DNA, while the other cleaved unmethylated DNA at a wide variety of locations along the length of the molecule.

First, you need to find something that contains DNA. Since DNA is the blueprint for life, everything living contains DNA. For this experiment, we like to use green split peas. But there are lots of other DNA sources too, such as: Pour your thin pea-cell soup through a strainer into another container ...

Activities. Make an Origami DNA model at DNAi website. Or download the PDF files for Instructions and Template.; Take the "Tour of the Basics" at the Genetic Science Learning Center. With this Activity, simulate "RNA Transcription" and get the Templates for RNA and DNA nucleotides. These are suggestions for the order of DNA bases. They can be cut out and one given to each group.

Definition: It is technique used in genetic engineering that involves the identification, isolation and insertion of gene of interest into a vector such as a plasmid or bacteriophage to form a recombinant DNA molecule and production of large quantities of that gene fragment or product encoded by that gene.

To make sense of the test results: Each one of the inquirer's™ chromosome 4™s is being tested for FSHD. First they are cut with an enzyme called EcoRI and then further checked to see if it is an unusual arrangement of DNA with another enzyme which further cuts the DNA called BlnI.
